

How they work

InkFlatables were developed to give power to the end user to print their own balloons. Our slogan is “Balloons Designed by You, Printed by You”. InkFlatables are easy to use and require no special printer or hardware. Use our software (free download access included with purchase) to design your balloon using your own photos or images, and print using ANY inkjet printer (both sides of the balloon are printable). Once you have printed to both sides of the balloon, tear the balloon shape off the paper along the perforated edges of the design (star, heart or ball). Insert the included valve into the neck (opening) of the balloon.

Use our software (free download access included) to design your balloon using your own photos or images, and print using any inkjet printer (both sides of the balloon are printable).

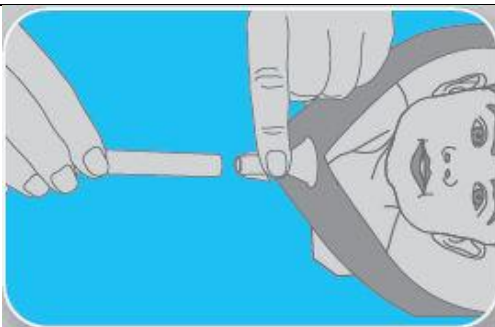

Once you have printed to both sides of the balloon, tear the balloon shape off the paper along the perforated edges of the design (star, heart or ball).

Insert the included valve into the neck (opening) of the balloon.

Attach both of the included caps around the neck of the balloon to hold the valve in place.

Place the included, hollow plastic handle over the caps and push it in place to make a tight seal.

Inflate the balloon by blowing into the hollow plastic handle. The valve is a one-way-valve so air will go in but cannot escape, ensuring that the balloon stays inflated.
